Below are the score and rank data from the 62nd William Lowell Putnam Mathematical Competition held in December, 2001. The chart is reproduced exactly as it is presented in the mailings from the Competition organizers.

| Score | Rank | Score | Rank | Score | Rank | Score | Rank | Score | Rank |
|-------|------|-------|-------|-------|-------|-------|-------|-------|--------|
| 101 | 1 | 61 | 37 | 44 | 123 | 32 | 225.5 | 13 | 606 |
| 100 | 2 | 60 | 47.5 | 43 | 125 | 31 | 252 | 12 | 655 |
| 86 | 3 | 59 | 56 | 42 | 130.5 | 30 | 287.5 | 11 | 759 |
| 80 | 4.5 | 58 | 59.5 | 41 | 143.5 | 29 | 314.5 | 10 | 970 |
| 79 | 6 | 57 | 62.5 | 40 | 164 | 28 | 324.5 | 9 | 1130.5 |
| 77 | 7.5 | 55 | 64 | 39 | 181.5 | 26 | 330 | 8 | 1154 |
| 73 | 9 | 54 | 66 | 38 | 190.5 | 24 | 332.5 | 5 | 1162.5 |
| 72 | 11 | 53 | 69 | 37 | 195 | 23 | 340 | 4 | 1166 |
| 71 | 14 | 52 | 72.5 | 36.9 | 197 | 22 | 365 | 3 | 1181.5 |
| 70 | 16.5 | 51 | 78 | 36.8 | 198 | 21 | 414.5 | 2 | 1252 |
| 69 | 19 | 50 | 93.5 | 36.7 | 199 | 20 | 494 | 1 | 1469.5 |
| 68 | 23.5 | 49 | 109 | 36.6 | 200 | 19 | 555 | 0 | 2292 |
| 67 | 27.5 | 48 | 115 | 36 | 202 | 18 | 570.5 | | |
| 66 | 29 | 47 | 118.5 | 35 | 204 | 17 | 575 | | |
| 63 | 30 | 46 | 120.5 | 34 | 205 | 15 | 577 | | |
| 62 | 32 | 45 | 122 | 33 | 209 | 14 | 586.5 | | |

-Putnam Scores and Ranks-

Note that the chart does not include the frequencies of the scores. This is an interesting omission because the frequencies are used to determine the rankings. Suppose a student, Putnam Pat, scored a 20. According to the table above, Pat's is the 59th highest score, giving a rank of 494.

Can anything more be said? Our goal in this note is to recover the frequencies from the rankings. We first choose some notation and explain how the rankings are determined. For $i = 1, 2, \dots, 76$ (76 being the number of different scores), let s_i denote the i^{th} score (where s_1 is the highest), let n_i be the number of students with score s_i , and let c_i be the number of students with score s_i or higher. Thus n_i is the i^{th} frequency and c_i is the i^{th} cumulative frequency. Finally, let r_i be the rank of the score s_i .

Since the rankings for the top three scores are 1, 2, and 3, it is clear that these scores were obtained by one student each. The rank 4.5 assigned to the fourth score of 80 indicates that more than one student had this score. In particular, 4.5 is the average of the places 4 and 5, so it follows that two students had this score. Here is the formula for the rankings:

$$r_i = \sum_{k=1}^{i-1} n_k + \frac{n_i + 1}{2} = c_{i-1} + \frac{n_i + 1}{2} \quad 1 \leq i \leq 76. \quad (1)$$

For example, $r_6 = 7.5$ means that two students scored 77, since $7.5 = 6 + \frac{2+1}{2}$. We will derive a simple formula for n_i in terms of the r_i .

First note that $r_i - r_{i-1} = \frac{1}{2}(n_i + n_{i-1})$, so $n_i + n_{i-1} = 2(r_i - r_{i-1})$. Thus,

$$n_i - n_{i-2} = (n_i + n_{i-1}) - (n_{i-1} + n_{i-2}) = 2(r_i - 2r_{i-1} + r_{i-2}),$$

and similarly,

$$n_i + n_{i-3} = (n_i - n_{i-2}) + (n_{i-2} + n_{i-3}) = 2(r_i - 2r_{i-1} + 2r_{i-2} - r_{i-3}).$$

Continuing in this fashion, we obtain

$$n_i + (-1)^i n_1 = 2\left(r_i - 2r_{i-1} + 2r_{i-2} \mp \cdots + (-1)^i 2r_2 + (-1)^{i-1} r_1\right).$$

Finally, since $n_1 = 2r_1 - 1$, we have

$$\begin{aligned} n_i &= 2\left(r_i - 2r_{i-1} + 2r_{i-2} \mp \cdots + (-1)^i 2r_2 + (-1)^{i-1} 2r_1\right) + (-1)^i \\ &= 2r_i + 4\sum_{k=1}^{i-1} (-1)^k r_{i-k} + (-1)^i \quad 1 \leq i \leq 76. \end{aligned} \quad (2)$$

With this formula (and a little help from a computer), we can present all the relevant data for the Putnam Competition.

| Score | Rank | Frequency | Cumulative Frequency | Score | Rank | Frequency | Cumulative Frequency |
|-------|-------|-----------|----------------------|-------|--------|-----------|----------------------|
| 101 | 1 | 1 | 1 | 38 | 190.5 | 6 | 193 |
| 100 | 2 | 1 | 2 | 37 | 195 | 3 | 196 |
| 86 | 3 | 1 | 3 | 36.9 | 197 | 1 | 197 |
| 80 | 4.5 | 2 | 5 | 36.8 | 198 | 1 | 198 |
| 79 | 6 | 1 | 6 | 36.7 | 199 | 1 | 199 |
| 77 | 7.5 | 2 | 8 | 36.6 | 200 | 1 | 200 |
| 73 | 9 | 1 | 9 | 36 | 202 | 3 | 203 |
| 72 | 11 | 3 | 12 | 35 | 204 | 1 | 204 |
| 71 | 14 | 3 | 15 | 34 | 205 | 1 | 205 |
| 70 | 16.5 | 2 | 17 | 33 | 209 | 7 | 212 |
| 69 | 19 | 3 | 20 | 32 | 225.5 | 26 | 238 |
| 68 | 23.5 | 6 | 26 | 31 | 252 | 27 | 265 |
| 67 | 27.5 | 2 | 28 | 30 | 287.5 | 44 | 309 |
| 66 | 29 | 1 | 29 | 29 | 314.5 | 10 | 319 |
| 63 | 30 | 1 | 30 | 28 | 324.5 | 10 | 329 |
| 62 | 32 | 3 | 33 | 26 | 330 | 1 | 330 |
| 61 | 37 | 7 | 40 | 24 | 332.5 | 4 | 334 |
| 60 | 47.5 | 14 | 54 | 23 | 340 | 11 | 345 |
| 59 | 56 | 3 | 57 | 22 | 365 | 39 | 384 |
| 58 | 59.5 | 4 | 61 | 21 | 414.5 | 60 | 444 |
| 57 | 62.5 | 2 | 63 | 20 | 494 | 99 | 543 |
| 55 | 64 | 1 | 64 | 19 | 555 | 23 | 566 |
| 54 | 66 | 3 | 67 | 18 | 570.5 | 8 | 574 |
| 53 | 69 | 3 | 70 | 17 | 575 | 1 | 575 |
| 52 | 72.5 | 4 | 74 | 15 | 577 | 3 | 578 |
| 51 | 78 | 7 | 81 | 14 | 586.5 | 16 | 594 |
| 50 | 93.5 | 24 | 105 | 13 | 606 | 23 | 617 |
| 49 | 109 | 7 | 112 | 12 | 655 | 75 | 692 |
| 48 | 115 | 5 | 117 | 11 | 759 | 133 | 825 |
| 47 | 118.5 | 2 | 119 | 10 | 970 | 289 | 1114 |
| 46 | 120.5 | 2 | 121 | 9 | 1130.5 | 32 | 1146 |
| 45 | 122 | 1 | 122 | 8 | 1154 | 15 | 1161 |
| 44 | 123 | 1 | 123 | 5 | 1162.5 | 2 | 1163 |
| 43 | 125 | 3 | 126 | 4 | 1166 | 5 | 1168 |
| 42 | 130.5 | 8 | 134 | 3 | 1181.5 | 26 | 1194 |
| 41 | 143.5 | 18 | 152 | 2 | 1252 | 115 | 1309 |
| 40 | 164 | 23 | 175 | 1 | 1469.5 | 320 | 1629 |
| 39 | 181.5 | 12 | 187 | 0 | 2292 | 1325 | 2954 |

-Frequencies and Cumulative Frequencies of the Putnam Scores-

Now we can easily say more about the results of the competition. For example, here is the information relevant to Putnam Pat: there were 99 (since $n_{59} = 99$) students who had a score of 20; there were 444 (since $c_{58} = 444$) students who had a score above 20; and since 2954 students

participated, there were $2954 - 543 = 2411$ (since $c_{59} = 543$) students who scored below 20. Furthermore, the scores resulting in prize money are more apparent. The Putnam fellows (the top five) had scores 101, 100, 86, and 80. The \$1000 winners (the next ten) had scores 79, 77, 73, 72, and 71. The \$250 winners (the next eleven) had scores 70, 69, and 68.

Notice that this inversion formula can be derived using linear algebra: the recurrence in equation (1)

$$\begin{aligned} r_1 &= \frac{n_1}{2} + \frac{1}{2} \\ r_2 &= n_1 + \frac{n_2}{2} + \frac{1}{2} \\ r_3 &= n_1 + n_2 + \frac{n_3}{2} + \frac{1}{2} \\ &\vdots \\ r_{76} &= n_1 + n_2 + \dots + n_{75} + \frac{n_{76}}{2} + \frac{1}{2} \end{aligned}$$

can be written as a matrix equation: $\bar{r} = A\bar{n} + \overline{1/2}$, where

$$\bar{r} = \begin{bmatrix} r_1 \\ r_2 \\ \vdots \\ r_{76} \end{bmatrix}, \quad \bar{n} = \begin{bmatrix} n_1 \\ n_2 \\ \vdots \\ n_{76} \end{bmatrix}, \quad \overline{1/2} = \begin{bmatrix} 1/2 \\ 1/2 \\ \vdots \\ 1/2 \end{bmatrix},$$

and

$$A = \begin{bmatrix} 1/2 & 0 & 0 & \dots & 0 \\ 1 & 1/2 & 0 & \dots & 0 \\ 1 & 1 & 1/2 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & 1 & 1 & \dots & 1/2 \end{bmatrix}.$$

Solving the linear system for \bar{n} yields $\bar{n} = A^{-1}(\bar{r} - \overline{1/2})$. So we can find the formula for the n_i if we find the inverse of the matrix A. Not surprisingly, because of the simple form of the matrix A, it is not hard to find the inverse, which is also a lower triangular matrix:

$$A^{-1} = \begin{bmatrix} 2 & 0 & 0 & 0 & \dots & 0 \\ -4 & 2 & 0 & 0 & \dots & 0 \\ 4 & -4 & 2 & 0 & \dots & 0 \\ -4 & 4 & -4 & 2 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ -4 & 4 & -4 & 4 & \dots & 2 \end{bmatrix}.$$

The equation for \bar{n} becomes

$$\bar{n} = \begin{bmatrix} 2 & 0 & 0 & 0 & \cdots & 0 \\ -4 & 2 & 0 & 0 & \cdots & 0 \\ 4 & -4 & 2 & 0 & \cdots & 0 \\ -4 & 4 & -4 & 2 & \cdots & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ -4 & 4 & -4 & 4 & \cdots & 2 \end{bmatrix} \begin{bmatrix} r_1 - 1/2 \\ r_2 - 1/2 \\ \vdots \\ r_{76} - 1/2 \end{bmatrix},$$

giving us

$$n_1 = 2(r_1 - 1/2) = 2r_1 - 1$$

$$n_2 = -4(r_1 - 1/2) + 2(r_2 - 1/2) = -4r_1 + 2r_2 + 1$$

$$n_3 = 4(r_1 - 1/2) - 4(r_2 - 1/2) + 2(r_3 - 1/2) = 4r_1 - 4r_2 + 2r_3 - 1$$

\vdots

$$n_{76} = -4(r_1 - 1/2) + 4(r_2 - 1/2) - \dots + 2(r_{76} - 1/2) = -4r_1 + 4r_2 - \dots + 2r_{76} - 1,$$

which is our solution (see (2)).
